

# another desklets [container]

Larry the Cow was a bit frustrated at the current state of desktop applets...

...until he tried adeskleets.

He found something fast, something small and robust that worked without tons of dependencies: something he could burn on his LiveCD, or that would run unmodified on his old X11 terminal at work, or even on his palm pilot. Something that would not grow to half a gigabyte of virtual memory after running a couple of hours. Something minimalistic in design, with deep Unix roots, that is portable, reliable and keeps compatibility with existing code on every new release. Larry the Cow liked it.
